

PARAMAGNETIC OXYGEN ANALYZER

DATA SHEET

ZAJ-6

This product is an analyzer which measures oxygen concentration in a sample gas by converting it into pressure, utilizing the magnetic property of oxygen.

When compared with the oxygen analyzers of other measuring systems, this oxygen analyzer features a faster response, and smaller influence by coexisting gas and combustible gas, etc.

Further, this analyzer is easy to use because of abundant functions such as discretionary range setting and interactive operation. It is usable in diverse field including control of various heat treating furnaces, combustion furnaces and other various fields.

FEATURES

- Non-contact detector with long-term superior stability**
The auxiliary gas is constantly drawn into the detector to prevent the detector from contacting with sample gas. This keeps the analyzer from contamination or corrosive gas, and thus ensuring its long-term stability.
- Highly sensitive mass flow sensor enables low concentration measurement**
The highly sensitive mass flow sensor is capable of O₂ measurement with minimum range of 0 to 1 vol%.
- Fast response: 90% response within 2 seconds**
The thin measuring cell in which sample gas flows so quickly enables fast measurement of O₂ concentration.
- Long-life detector with no moving parts**
Free from maintenance work because the detector has no moving parts. It also features vibration-proof and impact-resistant structure thanks to optimized flow channel. The sample cell is made of SUS304 which has high corrosion resistance.
- Interference compensation function (optional)**
Interference from other gas which has magnetic characteristics can be corrected.
Interference compensation is performed by measuring concentration of coexisting gas and inputting it as 1-5V DC signal.

SPECIFICATIONS

Measuring range:

Measuring range: Freely settable

Measuring range (vol% O ₂)	Reference gas
0 ~ 0.5 ... 100	N ₂ (100% vol% N ₂)
21 ~ 23 ... 100	Air (21 vol% O ₂)
100 ~ 98 ... 0	O ₂ (100 vol% O ₂)

Numbers of range: 2 ranges

Measuring system: Paramagnetic pressure type

Output signal: 4 to 20mA DC (load 550Ω max.)

Repeatability: Within ± 1% of full scale

Zero drift: Within ± 1.5% of full scale/week

Span drift: Within ± 1.5% of full scale/week

Flow rate of sample gas:

0.5L/min ± 0.05L/min (in ranges below 2 vol% O₂)

0.5L/min ± 0.2L/min (in 2 vol% O₂ or higher ranges)

Response time (90% response: *Indication start-up time):
2s or less

*The time (= 1sec.) required for gas replacement in the internal piping is not included.

Linearity: Within ± 1% of full scale

Reading fluctuation:

≤ ±2.0% FS for 0–2% or lower ranges

≤ ±1.5% FS for ranges above 0–2%

Sample gas temperature: 0 to 40°C

Pressure loss:

Approx. 1.3kPa (at sample gas flow rate 0.5L/min)

Reference gas: N₂, O₂ gas or air

Reference gas pressure:

70 kPa (Apply pressure of a magnitude described to the reference gas inlet.)

*Reference gas is supplied at the above pressure to allow for flow rates of 5 to 20mL/min.

Purging gas (dry air or N₂) flow rate: 1L/min, N₂ gas or air (flowed for purging corrosive ambient gas)

Gas inlet/outlet dimensions: Rc1/4 or NPT1/4

Materials of gas-contacting parts:

Teflon and 304 stainless steel

Warmup time: Approx. 2 hours

Display:

Liquid crystal display, concentration indication (4 digits), range indication (4 digits)

Output hold:

Output hold is possible during calibration.

Moving average time: 0 to 99.9s

Contact output:

SPST-NO contact, contact capacity: 250 V AC, 2A (resistive load)

Contact is closed during calibration and instrument failure

Power supply:

Voltage rating: 100 to 240V AC
 Allowable range: 85 to 264V AC
 Frequency: 50/60Hz

Power consumption: Approx. 90VA

Ambient temperature: -5 to +45°C

Ambient humidity: Less than 90% RH

Allowable (max.) external vibration:

1.0m/s²{0.1G}(0 to 30Hz)

0.5m/s²{0.05G}(30 to 100Hz)

Enclosure: Steel, for indoor use

External dimension (H×W×D):

Rack mount type 133 × 483 × 433mm

Flush mount type 132 × 483 × 433mm

Desk-top type 148 × 429 × 433mm

Mass: Approx. 9.5kg

Finish color: Front panel: Cool gray

Casing : steel

Installation condition:

- The instrument must be protected from direct sunlight and heat radiation from objects at high temperature.
- The instrument must be installed in a clean atmosphere free from corrosive or combustible gas.
- The instrument must be free from severe external vibrations. When fast response time is required, it should be used in a place free from vibration.

Mounting method:

Mounting on 19-inch rack, flush mounting on panel or desk top mounting

Note: At least 70% of the weight of the instrument must be supported by the bottom of the case. When mounting the instrument on a panel or 19-inch rack, add a support under rear side of the instrument.

EU Directive Compliance

LVD (2014/35/EU)

EN 61010-1

EN 62311

EMC (2014/30/EU)

EN 61326-1 (Table 2)

EN 61000-3-2 (Class A)

EN 61000-3-3

EN 61326-2-3

RoHS (2011/65/EU+(EU)2015/863)

EN IEC63000

OPTIONAL SPECIFICATION

Alarm output:

Upper limit alarm: SPDT contact

Contact capacity: 250 AC, 2A
 (resistive load)

Lower limit alarm: SPDT contact

Contact capacity: 250 AC, 2A
 (resistive load)

Remote range changeover:

Range can be changed by external signal

Range identification signal output:

Contact output; SPST-NO contact

Contact capacity: 250 AC, 2A (resistive load)

Output hold:

Each output can be held by external input signal

Communicating function:

RS-485 (MODBUS)

Half-duplex bit serial, start-stop synchronization

Contents: Parameter settings (read/write), measured values (read), instrument status (write)

Remark : When connecting via RS-232C interface, an RS-232C ↔ RS-485 converter should be used.

Automatic calibration:

Zero/span calibration is performed automatically at a preset cycle.

Calibration gas is supplied while driving the external electromagnetic valve.

Calibration gas density setting range:

Zero gas: 0.00 to 99.99%O₂ (0.01%O₂ step)

Span gas: 0.00 to 99.99%O₂ (0.01%O₂ step)

Calibration start:

Built-in timer or remote start signal

Output hold during calibration: Possible

Calibration gas flow time:

Configurable between 60 to 599 seconds

Calibration cycle:

1 to 99 hours (in hours) or 1 to 40 days (in days)

Contact output:

Calibration: SPST-NO contact

Contact capacity: 250V AC, 2A (resistance load)

Calibration error: SPST contact

Contact capacity: 250V AC, 2A (resistance load)

Contact output for solenoid valve: SPST contact

Contact capacity: 250V AC, 2A (resistance load)

Remote start:

Remote start input signal

Interference correction by interference gas measured value input:

The analyzer measures the concentration of the interference gas you selected, and calculates O₂ concentration based on the change of the interference gas concentration.

External interference gas measured value input:

1 to 5 V DC, 1range

Interference gas fluctuation range:

Reference concentration ± 20% F.S.

O₂ gas concentration correcting range:

Reference concentration ± 20% F.S.

Correction accuracy: ±10% F.S.

Requires factory adjustment.

Details of measurement gas will be checked when receiving an order.

Note 1) Factory default measurement range: 0 to 5/25 vol% O₂.

Note 2) • If you order the product version with the interference compensation function, fill in the table for checking sample gas component attached on the last page.

- An additional analyzer is required for measuring interference gas (CO₂ or CH₄).
- Input signal is 1 to 5V DC.
- Requires factory adjustment.
- Reverse range such as 100 to 0 %, and atmospheric air standard range are not available.

PRINCIPLE DIAGRAM

When the measured gas is placed in a magnetic field, oxygen molecules will be attracted. This gives rise to a pressure, which is detected by a mass flow sensor.

SCOPE OF DELIVERY

Analyzer × 1
 Fuse × 2
 Instruction manual × 1
 Accessory kit (ferrite core × 3, packin × 2, filter × 1)

ITEMS TO BE PREPARED SEPARATELY

- (1) Standard gas for calibration
 Code symbol ZBM□SY04-01
- (2) Reference gas
 - Measuring range 0 to 1 ... 100 vol% O₂
 N₂ : Code symbol ZBM□NY04-01
 - Measuring range 21 to 23 ... 100 vol% O₂
 Air : Code symbol ZBM□RY04-01
 or instrumentation air
 - Measuring range 100 to 98 ... 0 vol% O₂
 O₂ : Code symbol ZBM□SY04-01
- (3) Buffer tank
 ZBH410□3
 (Unrequired for versions with buffer tank.)
- (4) For version with interference compensation function
 CH₄ or CO₂ analyzer

Note

- (1) When using this analyzer, be sure to provide a buffer tank in the exhaust path immediately after the analyzer.
 This is required for preventing output fluctuation due to disturbances such as large noise and strong wind.
 (Unrequired for versions with buffer tank.)
- (2) If you use air as the reference gas, order the span gas with the concentration of 80–100% of full scale. Clearly specify that the gas should be made by gravimetric method and have the minimum accuracy corresponding to ±1% of full scale. Without this description, the span gas may contain unallowable concentration error.

Example of 21–23 vol% O₂ range:

Span gas concentration: 22.6–23.0% O₂, balance N₂

Accuracy: ≤ ±0.02% O₂

Made by gravimetric method

- (3) If you use O₂ as the reference gas and the full scale of your measurement range is 10 vol% O₂, use zero gas that has a minimum purity of 99.99%. For other ranges, use the zero gas that has minimum purity of 99.9%.

Production example 1)

If you request the production of a span calibration gas in the 100 to 95% O₂ range, please use the gravimetric method to produce a 10 L cylinder with a concentration range of 95 to 96% O₂/N₂ balance or prepare a calibration gas corresponding to a gas produced by the gravimetric method.

Please include the manufacturer's inspection report.

Production example 2)

If you request the production of a span calibration gas in the 100 to 98% O₂ range, please use the gravimetric method to produce a 10 L cylinder with a concentration range of 98 to 99% O₂/N₂ balance.

Please include the manufacturer's inspection report (JCSS certificate).

- (4) Use a copper pipe (6/4 copper pipe) for the reference line. It should be as short as possible from the gas cylinder. The longer the pipe is, the longer the time is required until the reading stabilize. Do not use a plastic pipe, as it causes errors in reading due to permeation of oxygen.

<Table for checking sample gas component of paramagnetic oxygen gas analyzer (ZAJ-6)>

Let us check your sample gas for safe use of Fuji Electric' gas analyzer.

Make entries where you can answer. If there is any question, contact our salesperson in charge of your company.

The analyzer may not provide full performance depending on other gas components contained in sample gas.
