

NDIR GAS ANALYZER

DATA SHEET

ZPA

OVERVIEW

This gas analyzer (ZPA) can measure the concentration of NO, SO₂, CO₂, CO, CH₄ and O₂ in sample gas. NO, SO₂, CO₂, CO and CH₄ are measured by non-dispersion infrared method (NDIR), while O₂ is measured by a galvanic fuel cell, paramagnetic sensor, or zirconia sensor.

Up to five components including O₂ can be measured.

ZPA also features its compact design that enables downsizing of measurement system, and simple structure with single-beam IR system that requires minimal maintenance.

ZPA is best suited to the measurement of exhaust gas from refuse incinerators, boilers, and various industrial furnaces.

FEATURES

1. Compact and lightweight

Standard Functions**Output signal holding:**

Enables you to hold the output signal during calibration, to the value right before the calibration is started or the user-specified value. Values indicated on LCD will not be held.

Range changeover:

You can change between ranges by manually, automatically, or remotely.

Manual: by key operation

Auto: When the measured value reaches above 90% FS of the 1st range, the range automatically switches to the 2nd range. When the measured value goes down below 80% FS of the 1st range, the range automatically switches from the 2nd range to the 1st range.

Remote: by the contact input (option).

When the specified voltage (the remote range change-over signal) is applied on the contact dedicated for each component, the 1st range is effective. When no voltage is applied, the 2nd range becomes effective.

Optional Functions**Remote output holding:**

Applying the specified voltage on the dedicated terminal allows you to hold the output signal to the last value or the user-specified value. Holding is effective while the voltage is applied. Values indicated on LCD are not held.

Range identification signal:

You can check which range is in use.

Auto calibration:

This function requires standard gas cylinders for calibration and solenoid valves for opening/closing the gas flow line. When this function is activated, the analyzer opens and closes the solenoid valve driving contact periodically at preset cycle.

Auto calibration cycle setting:

1 hour to 99 hours (in increments of 1 hour) or

1 day to 40 days (in increments of 1 day).

Gas flow time setting:

The time during which calibration gas is drawn

60 seconds to 900 seconds (in increments of 1 second)

Auto calibration remote start:

When you apply the specified voltage for 1.5 seconds or longer on the auto calibration remote start contact and then open the contact, one-time auto calibration starts. Calibration gas is drawn for the time set in the "gas flow time setting" for Auto calibration (see the previous item).

Auto zero calibration:

This function requires a standard gas cylinder for zero calibration and a solenoid valve for opening/closing the gas flow line. When this function is activated, the analyzer opens and closes the solenoid valve driving contact periodically at preset cycle. The cycle for the auto zero calibration and that for the auto calibration can be different.

Auto calibration cycle setting:

1 hour to 99 hours (in increments of 1 hour) or

1 day to 40 days (in increments of 1 day).

Gas flow time setting:

The time during which calibration gas is drawn

60 seconds to 900 seconds (in increments of 1 second)

Upper/lower limit alarm:

When an instantaneous value has gone beyond the upper limit or below the lower limit, the analyzer closes the contact to emit an alarm signal. Up to four alarms are available.

Instrument error contact output:

The contact is closed if a device error occurs.

Calibration error contact output:

The contact is closed if a calibration error occurs.

Auto calibration status contact output:

The contact is closed during auto calibration.

O₂ correction:

Conversion of measured NO, CO, and SO₂ gas concentrations into values at reference O₂ concentration

Correction formula:

$$C = \frac{21\text{-On}}{21\text{-Os}} \times C_s$$

C: Sample gas concentration after O₂ correction

C_s: Measured concentration of sample gas

O_s: Measured O₂ concentration

O_n: Reference O₂ concentration

(changeable by setting)

* The upper limit value of the fractional part in this calculation is 4. The result of calculation is indicated and transmitted as an analog output signal.

Average value after O₂ correction and O₂ average value calculation:

The analyzer can take measurement every 30 seconds, and calculate the moving average of instantaneous concentration after O₂ correction or instantaneous O₂ value per the period you set; in the range 1–59 min (in one minute increment) or 1–4 hour (in one hour increment). The analyzer transmits the moving average output every 30 seconds.

Average value resetting:

The above-mentioned output of average value is started from the initial state by opening the average value resetting input terminals after short circuiting for 1.5 sec or longer. Output is reset by input voltage and restarted by opening the terminal circuit.

Communication function:

RS-485 (9pins D-sub connector)

Half-duplex bit serial

Start-stop synchronization

Modbus RTU™ protocol

Contents: Read/Write parameters

Read measurement concentration and instrument status

When connecting via RS-232C interface, an RS-232C ↔ RS-485 converter should be used.

Atmospheric pressure correction:

Measure atmospheric pressure and calculate compensation (for use, be sure to relieve the exhaust gas from analyzer to the atmosphere)

After atmospheric pressure correction;

Zero point: No influenced

Span point: The change is 0.5% measured value or less relating to the change of the atmospheric pressure 1%.

Correction range: 700hPa-1050hPa

Performance

Repeatability:

±0.5% of full scale

Linearity:

1% of full scale

prior to atmospheric pressure correction (option)

Zero drift:

±2% of full scale/week

In the case of NO and/or SO₂ measurement below 500 ppm range, with the auto zero calibration used.

Span drift:

±2% of full scale/week

Response time (for 90% FS response) :

1 to 15 sec electrical response. Within 10-30 seconds including replacement time of sampling gas.

Gas replacement time depends on the number of measuring components, and measuring range.

Interference from other gases:

Interference component	CO ₂ analyzer	CO analyzer	CH ₄ analyzer	SO ₂ analyzer	NO analyzer
CO	≤ 1.0 % FS	–	≤ 1.0 % FS	≤ 1.0 % FS	≤ 1.0 % FS
CO 1000 ppm	–	≤ 1.0 % FS ^{*1}	≤ 1.0 % FS	≤ 1.0 % FS	≤ 1.0 % FS ^{*2}
CO ₂ 15%	–	≤ 1.0 % FS ^{*3}	≤ 1.0 % FS	–	–
H ₂ O saturation at 20°C	≤ 1.0 % FS	≤ 1.0 % FS ^{*3}	≤ 1.0 % FS	–	–
H ₂ O saturation at 2°C	–	≤ 2.0 % FS	–	≤ 2.0 % FS	≤ 2.0 % FS
CH ₄ 1000 ppm	≤ 1.0 % FS	≤ 1.0 % FS	–	≤ 20 ppm	–

*1: 0–200 ppm range: ≤ 2.0% FS

*2: 0–500 ppm range: ≤ 2.0% FS

*3: 0–500 ppm range: ≤ 2.0% FS

Interference for 0–200 ppm range may be greater than 2.0% FS depending on conditions.

- note1) If you select "D" in the 4th code, the analyzer comes with the power cable. Specify the rating of the power cable in the 20th code.
- note2) If you use this analyzer only for oxygen measurement, select "Y" in the 6th code.
- note3) If you use an external O₂ sensor (7th code "1"), set 0–1 V DC linear signals from the external O₂ analyzer so that they corresponds to the full scale setting of the analyzer.
Note that the external O₂ analyzer (7th code "1") and the external zirconia O₂ sensor ZFK7 (7th code "2") need to be ordered separately.
- note4) Check the possible combination of measuring components and ranges in Table 1. Specify the range with the range codes shown in the above tables.
- note5) If you select "D" in the 4th code, select the appropriate cable specification for end user in the 20th code.
If you select "A" in the 4th code, the power cable is not supplied. If you need no power cable and want to order the manual written in English, select "E" in the 20th code.
- note6) O₂ correction is provided only for NO, SO₂, and CO measurement.
When "H" is specified for the 6th digit, "A, B, or C" cannot be selected for the 21st digit.

Range selection procedure

One component analyzer:

First determine 1st range, then select 2nd range from the corresponding column.

Two or more component analyzer:

1. Check the available options referring to the below tables, and determine the 1st range. Select the corresponding range code from "NDIR range codes" on Page 8.
2. The 2nd range must be greater than the 1st range but no greater than the value in the column "2nd range (max.)". Check the available options referring to the below tables, and determine the 2nd range. Select the corresponding range code from "NDIR range codes" on Page 8.

Repeatability: Within $\pm 0.5\%$ of full scale

Linearity: Within $\pm 1\%$ of full scale

Zero drift: Within $\pm 1\%$ of full scale/week

Span drift: Within $\pm 2\%$ of full scale/week

Response time: Approx. 20 seconds (for 90% response)

Measured gas flow rate:

 $0.5 \pm 0.25 \text{ L / min}$

Notes:

- If process gas is combustible, measurement error may occur due to oxygen contained in the process gas.
- If process gas is corrosive (for example, SO₂ beyond 250 ppm range), the service life of zirconia sensor may be shortened.

Gas inlet/outlet size:

Rc^{1/4} or NPT^{1/4}
